S5_Testing_Magmasat

March 23, 2021

1 This notebook tests the outputs of VESIcal to Magmasat

- Test 1 compares saturation pressures published by Bennett et al. (2019; Nature; https://www.nature.com/articles/s41586-019-1448-0?draft=collection), who used the Mac App to those calculated using VESIcal
- Test 2 compares the isobars shown in Fig. 14 of Ghiorso and Gualda (2015) to those calculated with VESIcal. We note that although the figure caption says that the composition of the Late Bishop Tuff was used, their isobars are best recreated using the composition of the Early Bishop Tuff.
- Test 3 compares X_{H_2O} calculated using the "Fluid+magma from bulk composition" option of the web app with the calculate_equilibrium_fluid_comp function of VESIcal for a set of synthetic inputs.

```
[1]: import sys
    sys.path.insert(0, '../../../')

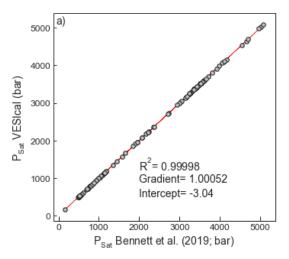

import VESIcal as v
